

## Manchester Middle School Chesterfield, VA

LIDAR (laser) scanning can sometimes be used to double-check a fixed-seating layout with respect to major renovations or new construction, where the real space may allow for flexibility not immediately clear in the architectural drawings. Such was the case with Manchester Middle School, where scans indicated the ability to use wider seats in the rear section of the room and increase the overall back-to-back spacing between rows. Capacity remained the same but the comfort and usability of the auditorium greatly benefited from the added level of precision. Don't let the image fool you! Scans can look like photographs, but the data they bring to the table can help maximize the end-user experience.

*Irwin Seating: Millennium model # 91.12.20.4*
